

The NMIS is a teacher-influenced tool, designed to provide instructional planning support at the programmatic level for districts and instructional level for teachers. Its foundation stems from the vision and mission of the PED and came into existence to assure that students in NM will be engaged in a culturally and linguistically responsive educational system that meets the social, emotional, and academic needs of ALL students. This is also rooted in the belief that all students must have access to on-grade-level standards, focusing on acceleration. The purpose of this tool is to help educators understand each of the grade level standards and how those standards connect to the students' overall preparation for college and career readiness.

Standards are defined as the most critical prerequisite skills and knowledge. This document is color-coded to reflect both anchor and priority standards. Though previous emphasis was placed on priority standards to address lost learning due to COVID-19, New Mexico teachers should note that moving forward, while priority standards allow for acceleration of learning, all standards should be addressed in instruction throughout the school year.

In this guide you will find:

- A [breakdown](#) of each of the grade level standards within the cluster, including:
  - Standards of Mathematical Practice
  - Common Misconceptions
  - Identification of Priority Standards, as identified by NMPED.
  - Level of Rigor Identification
- Sample aligned [assessment](#) items
- [Student Discourse Guide](#) (**only provided for clusters with Conceptual Understanding standards**)
- A multilayered system of supports ([MLSS](#)) and culturally and linguistically responsive instruction (CLR) guide

Key		
	<i>Priority Standard</i>	Priority standards, as identified by NMPED, are denoted with red highlighting. Priority standards are the most critical prerequisite skills and knowledge a student needs. This does not mean that these are only standards required to be taught, just these are the standards that will allow for the acceleration the students of New Mexico need during this time.
	<i>Conceptual Understanding</i>	Conceptual Understanding standards help students build a deep understanding of the <b>how</b> and <b>why</b> of mathematics.
	<i>Application</i>	Application standards help students identify the appropriate concepts and skills to tackle <b>novel real-world problems</b> .
	<i>Procedural Skill and Fluency</i>	Procedural standards help students develop <b>efficiency</b> and <b>accuracy</b> in computations.

## Standards Breakdown

- Represent and solve problems involving multiplication and division
  - [CCSS.3.OA.A.1](#)
  - [CCSS.3.OA.A.2](#)
  - [CCSS.3.OA.A.3](#)
  - [CCSS.3.OA.A.4](#)
- Understand properties of multiplication and the relationship between multiplication and division
  - [CCSS.3.OA.B.5](#)
  - [CCSS.3.OA.B.6](#)
- Multiply and divide within 100
  - [CCSS.3.OA.C.7](#)
- Solve problems involving the four operations, and identify and explain patterns in arithmetic
  - [CCSS.3.OA.D.8](#)
  - [CCSS.3.OA.D.9](#)

3	Operations and Algebraic Thinking	Understand properties of multiplication and the relationship between multiplication and division
 <span style="font-size: 1.2em; font-weight: bold; vertical-align: middle;">Cluster Standard: 3.OA.B.5</span>		
Standard	Standards for Mathematical Practice	
Apply properties of operations as strategies to multiply and divide. Examples: If $6 \times 4 = 24$ is known, then $4 \times 6 = 24$ is also known. (Commutative property of multiplication.) $3 \times 5 \times 2$ can be found by $3 \times 5 = 15$ , then $15 \times 2 = 30$ , or by $5 \times 2 = 10$ , then $3 \times 10 = 30$ . (Associative property of multiplication.) Knowing that $8 \times 5 = 40$ and $8 \times 2 = 16$ , one can find $8 \times 7$ as $8 \times (5 + 2) = (8 \times 5) + (8 \times 2) = 40 + 16 = 56$ . (Distributive property.)	<ul style="list-style-type: none"> <li>● <b>SMP 2:</b> Reason abstractly and quantitatively.</li> <li>● <b>SMP 8:</b> Look for and express regularity in repeated reasoning.</li> </ul>

### Common Misconceptions

- Many students may think a pattern occurs if it only happens twice.

### Student Discourse Guide

- **Purposeful, rich classroom discourse offers students the opportunity to express their ideas, thinking, and to critique the reasoning of others in a variety of ways (writing, drawing, verbal). Purposeful implementation of classroom discourse allows students to activate funds of knowledge and to refine their mathematical understanding. When students have frequent opportunities for discourse they find various paths to solutions and reveal knowledge or misunderstandings to educators. The process also allows educators to honor students' culture, lived experiences and evolving math identities.**

- Discourse that focuses on tasks that promote reasoning and problem solving is a primary mechanism for developing conceptual understanding and meaningful learning of mathematics (Michaels, O'Connor, and Resnick, 2008)

Domain: **Operations and Algebraic Thinking**

Strand: **Represent and solve problems involving multiplication and division**

<b>3</b>	<b>Operations and Algebraic Thinking</b>	<b>Represent and solve problems involving multiplication and division</b>
	<b>Sample Task #1 (Constructed Response)</b>	
	These are the desks in Ms. Green’s classroom.	

There is one desk for each student in Ms. Green’s class.

a. Write a multiplication number sentence that can be used to find the number of students in the class.

Ms. Green wants to arrange the desks so that there are 3 equal rows.

b. How many desks will be in each row?

Ms. Green wants to arrange the desks so that there are 9 desks in each of the 3 rows.

c. How many more desks will Ms. Green need so that each row can have 9 desks? Show your work or explain how you know.

**Sample Task #2 (Multiple Choice)**

Tom writes this expression on his paper.

$$28 \div 4$$

Which situation could Tom’s expression represent?

- A. Tom has 28 books and gives 4 of them to his friend.
- B. Tom gives 28 books to each of his 4 friends.
- C. Tom has 28 books and buys 4 more books.
- D. Tom puts 28 books equally on 4 shelves.

<b>Culturally and Linguistically Responsive Instruction</b>	
<b>Relevance to Families and Communities</b>	During a unit focused on representing and solving problems involving multiplication and division, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, when cooking a meal or dessert your child could figure out how much each family member should get which will be an introduction to fractions.

<p><b>Cross-Curricular Connections</b></p>	<ul style="list-style-type: none"> <li>● <b>Language Arts:</b> Essential vocabulary: multiplication, factor, array, equal groups, and repeated addition. Writing math word problems utilizing punctuation and spelling. Also include a five square graphic organizer that includes 1. The question, 2. Important information from the problem, 3. visual representation of the important information to solve the problem, 4. Solve the problem, 5. Students explain in writing what they did to solve the problem and why they used their method to solve the problem.</li> </ul>	
<p><b>Validate/Affirm/Build/Bridge</b></p>	<ul style="list-style-type: none"> <li>● <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>● <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within school and society?</i></li> </ul>	<ul style="list-style-type: none"> <li>● <b>Using and Connecting Mathematical Representations:</b> The standard for mathematical practice, use appropriate tools strategically, provides a strong foundation to validate and bridge for students. Mathematical 7 representations are mathematical tools. The linguistic and cultural experiences of students provide different and varied types of representations for solving mathematical problems. By explicitly encouraging students to use multiple mathematical representations students can draw on their “mathematical, social, and cultural competence”. By valuing these representations and discussing them we can connect student representations to the representations of school mathematics and build a bridge for students to position them as competent and capable mathematicians. For example, when studying representing and solving problems involving multiplication and division the use of mathematical representations within the classroom is critical because it aids students in understanding the reasoning or the WHY behind the mathematics. Although procedural knowledge of multiplication and division is quicker, they are just steps without the understanding of the concepts and the procedure. Visual representations how students better visualize and quantify the numbers and concepts.</li> </ul>

**Suggested Instructional Strategies**

**Pre-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that introduces new representations (e.g., number lines) when studying representing and solving problems involving 5 multiplication and division because understanding the visual representations will help students understand the concept. Understanding the visual representations will also help provide students with a strategy to record their understanding.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	2.OA.C.4 Use addition to find the total number of objects arranged in rectangular arrays with up to 5 rows and up to 5 columns; write an equation to express the total as a sum of equal addends. This standard provides a foundation for work with representing and solving problems involving multiplication and division because it provides students with the foundation and understanding of the visual representation of arrays. It also provides the basis of the understanding of multiplication being repeated addition. If students have unfinished learning within this standard, based on

		assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.
<b>Universal Support Framework</b>		
A student should know/understand...	A student should be able to do...	<b>Potential Scaffolds</b>
<ul style="list-style-type: none"> <li>● Multiplication is repeated addition</li> <li>● Division is repeated subtraction</li> <li>● Arrays can be used to model multiplication and division problems</li> <li>● The rows and columns of an array differ based on orientation of the array</li> <li>● Multiplication and division are inverse operations of each other and either can be used to "undo" the other operation</li> </ul>	<ul style="list-style-type: none"> <li>● Find products of whole numbers as the total number of objects in <math>n</math> groups of <math>n</math> objects each.</li> <li>● Solve multiplication problems by using equal groups, arrays, area, and/or measurement quantities.</li> <li>● Represent a real-world multiplication/division problem as a mathematical equation.</li> <li>● Represent a word problem using multiple methods, such as a picture, an equation with a symbol for the unknown number, etc.</li> </ul>	<ul style="list-style-type: none"> <li>● Build on students' experience with the following skills:             <ul style="list-style-type: none"> <li>○ Rectangular arrays and repeated addition (2.OA.4)</li> <li>○ Skip counting by 2s, 5s 10s, and 100s (2.NBT.2)</li> <li>○ Partitioning shapes and groups of objects into equal shares (2.G.2, 2.G.3)</li> <li>○ Solving one- and two step addition and subtraction word problems (2.OA.1)</li> <li>○ Solving equations for the unknown</li> </ul> </li> <li>● Cognitive Strategies             <ul style="list-style-type: none"> <li>○ Repeatedly model the strategies</li> <li>○ Monitor the students' use of the strategies</li> <li>○ Provide feedback to students</li> <li>○ Teach self-questioning and self-monitoring strategies</li> <li>○ Introduce multiple means of representation for mathematical ideas</li> </ul> </li> <li>● Encourage students to use alternative tools to better access the grade level content. This can include tools like:             <ul style="list-style-type: none"> <li>○ Graphic organizers</li> <li>○ Unifix cubes</li> <li>○ Counters</li> </ul> </li> </ul>
<b>Re-Teach</b>		
<b>Level of Intensity</b>	<b>Essential Question</b>	<b>Examples</b>

Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on representing and solving problems involving multiplication and division by critiquing student approaches/solutions to make connections through a short mini-lesson because if students are able to critique student approaches and solutions they can then examine their own thinking and approach to determine if it is reasonable and accurate.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit representing and solving problems involving multiplication and division by offering opportunities to understand and explore different strategies because the more opportunities a student has to explore different strategies the more likely they will be able to find a strategy that makes sense to them and develop an understanding of a concept.
<b>Extension</b>		
<i><b>Essential Question</b></i>		<i><b>Examples</b></i>
What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?		For example, some learners may benefit from an extension such as the application of and development of abstract thinking skills when studying representing and solving problems involving multiplication and division because this will allow students to dive deeper into the concept and begin to explore the next steps of the standard. It also allows students to begin thinking about application of the concept.

CCSS Domain		CCSS Cluster	
<b>Operations and Algebraic Thinking</b>		<b>Understand properties of multiplication and the relationship between multiplication and division</b>	
<b>Culturally and Linguistically Responsive Instruction</b>			
<b>Relevance to Families and Communities</b>	During a unit focused on multiplication, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, when making a quilt or blanket of a certain size, with a certain size of squares, how many squares would you need to create or make a quilt/blanket.		
<b>Cross-Curricular Connections</b>	Science: Students could learn about Science by implementing information from plants, earth and space, cycles of life, animals, electricity and magnetism, and motion and sound to solve word problems.		
<b>Validate/Affirm/Build/Bridge</b>	<ul style="list-style-type: none"> <li><i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li><i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within school and society?</i></li> </ul>	<ul style="list-style-type: none"> <li><b>Building Procedural Fluency from Conceptual Understanding:</b> Instruction should build from conceptual understanding to allow students opportunities to make meaning of mathematics before focusing on procedures. When new learning begins with procedures it privileges those with strong prior familiarity with school mathematics procedures for solving problems and does not allow learning to build for more methods for solving tasks that occur outside of school mathematics. For example, when studying understanding properties of multiplication and the relationship between multiplication and division the types of mathematical tasks are critical because if procedural knowledge is built without conceptual understanding students are only learning a process or steps, however they are not learning the WHY or the meaning of the math. Without conceptual knowledge students are basically doing what a calculator or computer could accomplish. Through building a conceptual understanding of the properties of multiplication and the relationship of multiplication and division students do not have to rely merely on a procedure to get an answer. Students can think through the math and use the procedure as a tool for calculating their answer. Students should also then be able to assess the reasonableness of their procedural answer when</li> </ul>	

they have a conceptual understanding of the concept.

## Planning for Multi-Layered System of Supports

<i>Previous Learning</i>	<i>Current Learning</i>	<i>Future Learning</i>
<ul style="list-style-type: none"> <li>Connect to previous work understanding equal groups, skip counting by 2, 5, 10, 100's, work with arrays up to 5 rows and 5 columns. <b>(2.OA.3, 2.OA.4 and 2.NBT.2)</b></li> </ul>	<ul style="list-style-type: none"> <li>Connections to multiplication and division exist across the standards in third grade. <b>(3.OA.1) (3.OA.2)(3.OA.3) (3.MD.7) (3.OA.5) (3.OA.6) (3.NBT.3) (3.OA.4) (3.OA.7) (3.OA.8) (3.OA.9)</b></li> </ul>	<ul style="list-style-type: none"> <li>Connect to 4th grade, where students use multiplication and division with larger numbers. <b>(4.NBT.5) (4.NBT.6)</b></li> </ul>

### Suggested Instructional Strategies

#### Pre-Teach

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that rehearses prior learning when studying understanding properties of multiplication and the relationship between multiplication and division because when students review their understanding of arrays and multiplication as repeated addition, then they can begin to connect the concepts. Also, when students review their understanding of addition and subtraction as inverse operations, they can apply this knowledge to multiplication and division being inverse operations.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	3.OA.4 Interpret products of whole numbers, e.g., interpret $5 \times 7$ as the total number of objects in 5 groups of 7 objects each. For example, describe a context in which a total number of objects can be expressed as $5 \times 7$ . This standard provides a foundation for work with understanding properties of multiplication and the relationship between multiplication and division because once students are able to understand and interpret products, they can begin to build the understanding of

		<p>the properties of multiplication as well as the relationship of multiplication and division. If students have unfinished learning within this standard, based on assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.</p>
--	--	---

**Universal Support Framework**

A student should know/understand...	A student should be able to do...	<i>Potential Scaffolds</i>
<ul style="list-style-type: none"> <li>● Important multiplication properties.</li> <li>● Connections between multiplication models, written multiplication equations, and related division equations.</li> <li>● The solution to a division problem as a missing factor.</li> </ul>	<ul style="list-style-type: none"> <li>● Describe multiplication patterns and make generalizations.</li> <li>● Write equations that represent multiplication models.</li> <li>● Describe information in problem situations and relate that information to multiplication and division equations.</li> </ul>	<ul style="list-style-type: none"> <li>● Build on students' experience with the following skills:               <ul style="list-style-type: none"> <li>○ Using repeated addition (<a href="#">2.OA.C.4</a>)</li> <li>○ Arranging objects in rectangular arrays (<a href="#">2.OA.C.4</a>)</li> <li>○ Write an equation to express the total as a sum of equal addends. (<a href="#">2.OA.C.4</a>)</li> <li>○ Skip counting by grouping objects (<a href="#">2.OA.C.3</a>)</li> </ul> </li> <li>● Cognitive Strategies               <ul style="list-style-type: none"> <li>○ Repeatedly model the strategies</li> <li>○ Monitor the students' use of the strategies</li> <li>○ Provide feedback to students</li> <li>○ Teach self-questioning and self-monitoring strategies</li> <li>○ Introduce multiple means of representation for mathematical ideas</li> </ul> </li> <li>● Encourage students to use alternative tools to better access the grade level content. **Re-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on understanding properties of multiplication and the relationship between multiplication and division by revisiting student thinking through a short mini-lesson because through resisting their thinking students will need to think deeper about the ideals they have formed. Often through revisiting their thinking students will begin to find misconceptions or errors in their reasoning that they must re-examine in order to explain.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit understanding properties of multiplication and the relationship between multiplication and division by helping students move from specific answers to generalizations for certain types of problems because this allows students to develop patterns and understand what the product is and how it relates to division. Rather than just a memorization of the facts, students need an understanding of what the product represents in order to understand multiplication and its relationship to division. Through understanding the properties of multiplication students will better understand how it is related to division.
<b>Extension</b>		
	<i>Essential Question</i>	<i>Examples</i>
What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?		For example, some learners may benefit from an extension such as the opportunity to explore links between various topics when studying understanding properties of multiplication and the relationship between multiplication and division because it allows students to extend their understanding of multiplication and division and relate it to the relationship of other operations. It also helps students begin to explore the relationship of larger numbers.

CCSS Domain		CCSS Cluster	
<b>Operations and Algebraic Thinking</b>		<b>Multiply and divide within 100.</b>	
<b>Culturally and Linguistically Responsive Instruction</b>			
<b>Relevance to Families and Communities</b>	During a unit focused on multiplying and dividing within 100 fluently, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, learning about the different ways multiplying is used in the home and community for planning, shopping and cooking can a be a great way to connect schools tasks with home tasks.		
<b>Cross-Curricular Connections</b>	Social Studies: Calculations related to populations, supply, goods, costs.		
<b>Validate/Affirm/Build/Bridge</b>	<ul style="list-style-type: none"> <li>• <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>• <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within school and society?</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Goal Setting:</b> Setting challenging but attainable goals with students can communicate the belief and expectation that all students can engage with interesting and rigorous mathematical content and achieve in mathematics. Unfortunately, the reverse is also true, when students encounter low expectations through their interactions with adults and the media, they may see little reason to persist in mathematics, which can create a vicious cycle of low expectations and low achievement. For example, when studying multiplying and dividing within 100 fluently, goal setting is critical because students will need short term goals for learning facts clusters from memory because there are too many facts which would be overwhelming for students to memorize without having them broken down into smaller achievable pieces.</li> <li>• <b>Tasks:</b> The type of mathematical tasks and instruction students receive provides the foundation for students' mathematical learning and their mathematical identity. Tasks and instructions that provide greater access to mathematics and convey the creativity of mathematics by allowing for multiple solution strategies and development of the standards for mathematical practice lead to more students viewing themselves mathematically successful capable mathematicians than tasks and instruction</li> </ul>	

		<p>which define success as memorizing and repeating a procedure demonstrated by the teacher. For example, when studying multiplying and dividing within 100 fluently the types of mathematical tasks are critical because students need to rely on a multitude of strategies to be able to understand and find products and quotients before they can commit the facts to memory.</p>

## Planning for Multi-Layered System of Supports

### Vertical Alignment

Previous Learning	Current Learning	Future Learning
<ul style="list-style-type: none"> <li>Connect to previous work understanding equal groups, skip counting by 2, 5, 10, 100's, work with arrays up to 5 rows and 5 columns. <b>(2.OA.3, 2.OA. 4 and 2.NBT.2)</b></li> </ul>	<ul style="list-style-type: none"> <li>Connections to multiplication and division exist across the standards in third grade. <b>(3.OA.1) (3.OA.2)(3.OA.3) (3.MD.7) (3.OA.5) (3.OA.6) (3.NBT.3) (3.OA.4) (3.OA.7) (3.OA.8) (3.OA.9)</b></li> </ul>	<ul style="list-style-type: none"> <li>Connect to 4th grade, where students use multiplication and division with larger numbers. <b>(4.NBT.5) (4.NBT.6)</b></li> </ul>

### Suggested Instructional Strategies

#### Pre-Teach

Level of Intensity	Essential Question	Examples
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that uses images/resources (especially those being used the first time) when studying multiplying and dividing within 100 fluently because students will need to use many different strategies and properties for understanding multiplication and division in order to find products & quotients for both smaller and larger numbers.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	3.OA.A.1 & 2.OA.A.2: These standards provide a foundation for work with representing and solving problems involving multiplication and division by interpreting products of whole numbers & interpreting whole-number quotients of whole numbers because

		<p>students need to have a clear understanding of what multiplication &amp; division means (using arrays, equal groups, area models, and repeated addition) before they would be able to find products, quotients, and become fluent . If students have unfinished learning within this standard, based on assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.</p>
<b>Universal Support Framework</b>		
A student should know/understand...	A student should be able to do...	<i>Potential Scaffolds</i>
<ul style="list-style-type: none"> <li>● The relationship between multiplication and division.</li> <li>● How to use strategies for multiplication and division, including doubling, the Commutative Property, multiplying by nine as related to multiplication by ten, and thinking of division as an unknown factor problem.</li> <li>● What it means to compose and decompose numbers.</li> <li>● How to use known facts to help learn unknown facts.</li> </ul>	<ul style="list-style-type: none"> <li>● Use strategies to mentally/fluent multiply and divide numbers within 100.</li> <li>● Solve all products of two one-digit numbers effectively and efficiently.</li> </ul>	<ul style="list-style-type: none"> <li>● Build on students’ experience with the following skills: <ul style="list-style-type: none"> <li>○ Thinking about multiplication as equal groups and numbers in groups (interpret <math>5 \times 7</math> as 5 groups of 7 objects each). (3.OA.A.1)</li> <li>○ Understanding that division is partitioning objects into equal shares (interpret <math>35 \div 5</math> as 5 equal shares of 7 objects each). (3.OA.A.2)</li> <li>○ Applying the commutative property in addition. (1.OA.B.3)</li> <li>○ Using number bonds/fact families from addition and subtraction to explain the inverse relationship between multiplication and division.</li> </ul> </li> <li>● Cognitive Strategies <ul style="list-style-type: none"> <li>○ Repeatedly model the strategies</li> <li>○ Monitor the students’ use of the strategies</li> <li>○ Provide feedback to students</li> <li>○ Teach self-questioning and self-monitoring strategies</li> <li>○ Introduce multiple means of representation for mathematical ideas</li> </ul> </li> <li>● Encourage students to use alternative tools to better access the grade level content. Examples include: <ul style="list-style-type: none"> <li>○ Graph and/or array paper</li> </ul> </li> </ul>

		<ul style="list-style-type: none"> <li>○ Counters</li> <li>○ Number lines</li> <li>○ Snap cubes</li> <li>○ Number bond templates</li> <li>○ Distributive property templates</li> </ul>
<b>Re-Teach</b>		
<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on 3.OA.B Understanding properties of multiplication and the relationship between multiplication and division by clarifying mathematical ideas and/or concepts through a short mini-lesson because applying properties like the commutative property, associative property, distributive property, and fact family knowledge of multiplication & division and their relationship is crucial for students to use to access multiple strategies for finding products & quotients before becoming fluent with facts.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit 3.OA.A Represent and solve problems involving multiplication and division by addressing conceptual understanding because students need to concretely understand the meaning of multiplication concretely using arrays, equal groups, area models, tape diagrams, and repeated addition before they can become proficient at fact knowledge and retrieval.
<b>Extension</b>		
	<i>Essential Question</i>	<i>Examples</i>
	What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?	For example, some learners may benefit from an extension such as open ended tasks linking multiple disciplines when studying multiplying and dividing within 100 fluently because students could see the application of multiplying & dividing as well as be provided with a realistic opportunity to extend their ability to multiply by a double digit number based on prior strategies when

learning to multiply (such as decomposing numbers).

CCSS Domain		CCSS Cluster	
<b>Operations and Algebraic Thinking</b>		<b>Solve problems involving the four operations, and identify and explain patterns in arithmetic.</b>	
<b>Culturally and Linguistically Responsive Instruction</b>			
<b>Relevance to Families and Communities</b>	<p>During a unit focused on Solving problems involving the four operations, and identifying and explaining patterns in arithmetic, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, learning about the different examples of problem solving that occurs in the home and community can be a great connection to school. The problem solving can involve shopping, project costs, gardening resources, home repairs, building, and other home maintenance. Local jobs can also provide an opportunity to see the types of problem solving and pattern recognition that community workers are experiencing.</p>		
<b>Cross-Curricular Connections</b>	<p>Language Arts: Students can write down step by step instruction guides on arithmetic patterns using the addition table or multiplication table and explain how to use them using the properties of operation. Students can publish their guides and keep them in a resource writing center.</p>		
<b>Validate/Affirm/Build/Bridge</b>	<ul style="list-style-type: none"> <li>• <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>• <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Supporting Productive Struggle in Learning Mathematics:</b> The standard for mathematical practice, makes sense of mathematics and persevere in solving them is the foundation for supporting productive struggle in the mathematics classroom. "Too frequently, historically marginalized students are overrepresented in classes that focus on memorizing and practicing procedures and rarely provide opportunities for students to think and figure things out for themselves. When students in these classes struggle, the teacher often tells them what to do without building their capacity for persistence." Teachers need to provide tasks that challenge students and maintain that challenge while encouraging them to persist. This encouragement or "warm-demander" requires a strong relationship with students and an understanding of the culture of the students. For example, when studying Solving</li> </ul>	

	<p><i>culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within school and society?</i></p>	<p>problems involving the four operations, and identifying and explaining patterns in arithmetic. Supporting productive struggle is critical because students need to be able to access (low entrance) to the problem so they feel they are capable of solving the problem using their repertoire of skills whether it is using manipulatives, drawing pictures, or jumping to formulas. They need to receive support at whatever level they begin to continue through and have expectations that they can solve the problem with their current skills whether or not it is the most efficient. Their thinking and processes need to be validated for correctness and shared as are more efficient methods of peers. Perseverance and comprehension should be celebrated.</p>

**Pre-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will</i>	For example, some learners may benefit from targeted

	<i>prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	pre-teaching that rehearses prior learning when studying Solving problems involving the four operations, and identifying and explaining patterns in arithmetic because students will need to apply the prior knowledge of addition and subtraction in conjunction with the newer knowledge of multiplying and dividing when solving multi-step problems involving a combination of the four operations and identifying patterns.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	2.OA.A.1: Use addition and subtraction within 100 to solve one- and two-step word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions: This standard provides a foundation for work with representing and solving problems involving addition and subtraction because using and understanding addition and subtraction to solve one & two steps problems is foundational to solving more complex problems involving any combination of the 4 operations. If students have unfinished learning within this standard, based on assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.
<b>Universal Support Framework</b>		
A student should know/understand...	A student should be able to do...	<b>Potential Scaffolds</b>
<ul style="list-style-type: none"> <li>● Whether answers are reasonable by using number sense.</li> <li>● Connections between representations and equations that model a problem.</li> <li>● Why a number is rounded to the nearest 10 or 100.</li> <li>● The properties of operations.</li> </ul>	<ul style="list-style-type: none"> <li>● Use a variety of problem-solving strategies, including relating the problem in their own words, making models, and drawing pictures to represent their thinking.</li> <li>● Use letters to represent unknown quantities.</li> <li>● Recognize patterns in the addition and multiplication tables.</li> </ul>	<ul style="list-style-type: none"> <li>● Build on students' experience with the following skills:             <ul style="list-style-type: none"> <li>○ Solving word problems involving addition and subtraction (2.MD.5)</li> <li>○ Fluently add and subtract up to 20 (2.OA.1)</li> </ul> </li> <li>● Cognitive Strategies             <ul style="list-style-type: none"> <li>○ Repeatedly model the strategies</li> <li>○ Monitor the students' use of the strategies</li> <li>○ Provide feedback to students</li> <li>○ Teach self-questioning and self-monitoring strategies</li> <li>○ Introduce multiple means of representation for mathematical ideas</li> </ul> </li> </ul>

		<ul style="list-style-type: none"> <li>● Encourage students to use alternative tools to better access the grade level content. Examples include:             <ul style="list-style-type: none"> <li>○ Counters</li> <li>○ Unifix cubes</li> <li>○ Geometric pattern blocks</li> <li>○ Multiplication Charts</li> </ul> </li> </ul>
<b>Re-Teach</b>		
<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on representing and solving problems involving multiplication and division by revisiting student thinking through a short mini-lesson because understanding and representing multiplication and division appropriately to solve one & two steps problems is foundational to solving more complex problems dependent on a mix of the 4 operations.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit on understanding properties of multiplication and the relationship between multiplication and division by offering opportunities to understand and explore different strategies because students may need to see, draw, and use manipulatives to better clarify their understanding of properties of multiplication (distributive, commutative, associative) with arrays, equal groups and number lines to concretely solidify their understanding of the properties.
<b>Extension</b>		
	<i>Essential Question</i>	<i>Examples</i>
	What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?	For example, some learners may benefit from an extension such as the opportunity to understand concepts more quickly and explore them in greater depth than other students when studying Solving problems involving the four operations, and identify and explain patterns in arithmetic because students can be provided

	the opportunity of solving more complex questions, problems, and patterns without scaffolding assistance.
