

The purpose of this tool is to help educators understand each of the grade level standards and how those standards connect to the students' overall preparation for college and career readiness.

The NMIS is a teacher-influenced tool, designed to provide instructional planning support at the programmatic level for districts and instructional level for teachers. Its foundation stems from the vision and mission of the PED and came into existence to assure that students in NM will be engaged in a culturally and linguistically responsive educational system that meets the social, emotional, and academic needs of ALL students. This is also rooted in the belief that all students must have access to on-grade-level standards, focusing on acceleration. The purpose of this tool is to help educators understand each of the grade level standards and how those standards connect to the students' overall preparation for college and career readiness.

Standards are defined as the most critical prerequisite skills and knowledge. This document is color-coded to reflect both anchor and priority standards. Though previous emphasis was placed on priority standards to address lost learning due to COVID-19, New Mexico teachers should note that moving forward, while priority standards allow for acceleration of learning, all standards should be addressed in instruction throughout the school year.

In this guide you will find:

- A [breakdown](#) of each of the grade level standards within the cluster, including:
  - Standards of Mathematical Practice
  - Common Misconceptions
  - Identification of Priority Standards, as identified by NMPED.
  - Level of Rigor Identification
- Sample aligned [assessment](#) items
- [Suggested Student Discourse Guide](#)
- A [multilayered system of supports \(MLSS\) and culturally and linguistically responsive instruction \(CLR\) guide](#)

Key		
	<i>Priority Standard</i>	Priority standards, as identified by NMPED, are denoted with red highlighting. Priority standards are the most critical prerequisite skills and knowledge a student needs. This does not mean that these are only standards required to be taught, just these are the standards that will allow for the acceleration the students of New Mexico need during this time.
	<i>Conceptual Understanding</i>	Conceptual Understanding standards help students build a deep understanding of the <b>how</b> and <b>why</b> of mathematics.
	<i>Application</i>	Application standards help students identify the appropriate concepts and skills to tackle <b>novel real-world problems</b> .
	<i>Procedural Skill and Fluency</i>	Procedural standards help students develop <b>efficiency</b> and <b>accuracy</b> in computations.

## Standards Breakdown

- Expressions and Equations Work with radicals and integer exponents
  - [8.EE.A.1](#)
  - [8.EE.A.2](#)
  - [8.EE.A.3](#)
  - [8.EE.A.4](#)
- Understand the connections between proportional relationships, lines, and linear equations.
  - [8.EE.B.5](#)
  - [8.EE.B.6](#)
- Analyze and solve linear equations and pairs of simultaneous linear equations.
  - [8.EE.C.7](#)
  - [8.EE.C.8](#)

Grade	CCSS Domain	CCSS Cluster
8	<b>EXPRESSIONS &amp; EQUATIONS</b>	Expressions and Equations Work with radicals and integer exponents
 <b>Cluster Standard: 8.EE.A.1</b>		
<b>Standard</b>		<b>Standards for Mathematical Practice</b>
Know and apply the properties of integer exponents to generate equivalent numerical expressions. For example, $3^2 \times 3^{-5} = 3^{-3} = \frac{1}{3^3} = \frac{1}{27}$ .		<ul style="list-style-type: none"> <li>● <b>SMP 2:</b> Reason abstractly and quantitatively.</li> <li>● <b>SMP 5:</b> Use appropriate tools strategically.</li> <li>● <b>SMP 6:</b> Attend to precision.</li> </ul>

### Common Misconceptions

<ul style="list-style-type: none"> <li>● Students may confuse the rules, which usually occurs when they are taught to memorize them rather than understand them. Students may also think that finding a power of a power involves adding exponents.</li> <li>● Students may confuse the relationship between division and negative exponents or forget about the order of operations.</li> </ul>	<ul style="list-style-type: none"> <li>● Some students may confuse square roots and cubes. Some might divide by 2 or 3 instead of finding the square root or cube respectively. Some students fail to recognize the relationship between square numbers and area or between cube numbers and volume.</li> <li>● Some students may forget that correct scientific notation requires that the first factor be written with only one digit to the left of the decimal.</li> </ul>
--	--

Some may struggle to understand which number should be divided when expressing how many times as much one number is than the other. Students may struggle if they add exponents that should be subtracted. Students can confuse the direction to move the decimal point when the exponent is negative

### Common Misconceptions

<ul style="list-style-type: none"> <li>• Students may make errors if they substitute incorrectly or confuse the variable terms and the constant.</li> </ul>	<ul style="list-style-type: none"> <li>• Students may confuse the slope and y-intercept. Some students might forget that the way two lines intersect or do not intersect shows the number of solutions for a system of equations. They may make the error of solving an equation by substituting in only one equation in the system, try to use elimination without eliminating a variable, or become confused as to where to include given information into an equation.</li> </ul>
---	--

### Student Discourse Guide

- Purposeful, rich classroom discourse offers students the opportunity to express their ideas, thinking, and to critique the reasoning of others in a variety of ways (writing, drawing, verbal). Purposeful implementation of classroom discourse allows students to activate funds of knowledge and to refine their mathematical understanding. When students have frequent opportunities for discourse they find various paths to solutions and reveal knowledge or misunderstandings to educators. The process also allows educators to honor students' culture, lived experiences and evolving math identities.
- Discourse that focuses on tasks that promote reasoning and problem solving is a primary mechanism for developing conceptual understanding and meaningful learning of mathematics (Michaels, O'Connor, and Resnick, 2008)

Ⓔ  $\begin{cases} 3x+2y=-4 \\ 6x+4y=-8 \end{cases}$

## MLSS AND CLR GUIDE

- [Work with radicals and integer exponents.](#)
- [Understand the connections between proportional relationships, lines, and linear equations.](#)
- [Analyze and solve linear equations and pairs of simultaneous linear equations.](#)

CCSS Domain		CCSS Cluster
Expressions and Equations	Work with radicals and integer exponents	
<b>Culturally and Linguistically Responsive Instruction</b>		
<b>Relevance to Families and Communities</b>	During a unit focused on working with radicals and integer exponents, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students by having students learn about the mathematics used within the different careers of their family members and community. Students can also research careers, mathematicians, or people influential in their culture and the ways they use math or have contributed to the field.	
<b>Cross-Curricular Connections</b>	<ul style="list-style-type: none"> <li>• <b>Science</b> - Distance of planets from the sun</li> </ul>	
<b>Validate/Affirm/Build /Bridge</b>	<ul style="list-style-type: none"> <li>• <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>• <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the</i></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Eliciting and Using Evidence of Student Thinking:</b> Eliciting and using student thinking can promote a classroom culture in which mistakes or errors are viewed as opportunities for learning. When student thinking is at the center of classroom activity, "it is more likely that students who have felt evaluated or judged in their past mathematical experiences will make meaningful contributions to the classroom over time." For example, when studying expression and equations work with radicals and integer exponents eliciting and using student thinking is critical because this standard is foundational to their future math concepts and other core subjects. When students are given an opportunity to present their process/solution with their own way of solving, empowers the students to take risks in the future and move forward with their learning.</li> </ul>

*culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within school and society?*

## Planning for Multi-Layered System of Supports

### Vertical Alignment

<i>Previous Learning</i>	<i>Current Learning</i>	<i>Future Learning</i>
<ul style="list-style-type: none"> <li>In 5th grade, students began to develop and understand the powers of 10 and the placement of the decimal when multiplying or dividing by powers of 10. In 6th grade, students continued to write and evaluate numerical expressions involving whole number exponents.</li> </ul>	<ul style="list-style-type: none"> <li>In 8th grade, students will connect the properties learned in this cluster to use square and square roots, cube and cube roots, when working with irrational numbers (NS standards) and volume (geometry standards).</li> </ul>	<ul style="list-style-type: none"> <li>In high school, learners will use properties of exponents to rewrite expressions and extend their knowledge of integer exponents to rational exponents.</li> </ul>

### Suggested Instructional Strategies

#### Pre-Teach

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that rehearses prior learning when studying expressions and equations that include radicals and exponents because connections can be formed to prior knowledge of writing and evaluating numerical expressions as students struggle, for example, to determine what a number to the 0 power might be based on what they previously know about powers. Or students may use prior knowledge to determine what $6^3 \cdot 6^4$ might be and explain their thinking. This can be a great lead into showing, in expanded form, WHY the

		answer is $6^7$ . This can work as a lead-in to division of powers or into discovery of the rules of exponents rather than just giving students the exponent rules. It is necessary for students to have a grasp of how to write and evaluate powers in order to move on to understanding the concepts behind multiplying and dividing by powers, negative powers, and powers of zero.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	<i>This standard provides a foundation for work with applying and extending previous understanding of arithmetic to algebraic expressions because students must understand how to write and evaluate numerical expressions using exponents. They must understand the difference between multiplying <math>3 * 4</math> and evaluating <math>3^4</math> in order to write equivalent expressions and evaluate expressions and equations involving powers. Students also need to understand the concept of repeated multiplication applied to powers for that knowledge to be transferred to repeated division being written as powers with negative exponents or as fractions with a numerator of 1 and a power in the denominator. These understandings of repeated multiplication and division and the use of structure in the repeated patterns can help students understand the concept of all numbers to the power of 0 equaling 1.</i>

**Re-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
<p>Targeted</p>	<p>What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?</p>	<p>For example, students may benefit from re-engaging with content during a unit on expressions and equations that include radicals and exponents by critiquing student approaches/solutions to make connections through a short mini-lesson because through analysis and sharing of student work on a bell ringer or exit ticket, misconceptions and common errors can be identified, corrected and valued in a safe and meaningful way that strengthens student learning, students will receive validation of their thinking , and students may gain a better understanding through the language and visuals provided by their peers. The mini lesson can be followed up with practice specifically geared toward correction of the misunderstanding or skill.</p>
<p>Intensive</p>	<p>What assessment data will help identify content needing to be revisited for intensive interventions?</p>	<p>For example, some students may benefit from intensive extra time during and after a unit on expressions and equations that include radicals and exponents by offering opportunities to understand and explore different strategies because working with radicals, cubed and square roots, numbers in scientific notation and powers can be complicated. Students need opportunities to compare numbers written differently to gain an understanding of relative sizes written in forms they are unfamiliar with. Students need opportunities to talk</p>

		about their strategies and thinking and to understand the notations and conversions and how they apply their understanding to solve problems.
<b>Extension</b>		
	<i><b>Essential Question</b></i>	<i><b>Examples</b></i>
	What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?	For example, some learners may benefit from an extension such as open-ended tasks linking multiple disciplines when studying expressions and equations work with radical and integer exponents because different exposure to this concept will lead to better appreciation and understanding of mathematics.

CCSS Domain	CCSS Cluster	
Expressions and Equations	Understand the connections between proportional relationships, lines, and linear equations	
<b>Culturally and Linguistically Responsive Instruction</b>		
Relevance to Families and Communities	<p>During a unit focused on the connections between proportional relationships, lines, and linear equations, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, by having students examine proportional relationships in different recipes. Having students make their favorite recipe that requires them to double or triple the ingredients based on the number of servings the recipe yields vs. the number of servings needed.</p>	
Cross-Curricular Connections	<ul style="list-style-type: none"> <li>● <b>Science:</b> Compare rates and relationships in scientific data.</li> </ul>	
Validate/Affirm/Build /Bridge	<ul style="list-style-type: none"> <li>● <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>● <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within</i></li> </ul>	<ul style="list-style-type: none"> <li>● <b>Posing Purposeful Questions:</b> CLRI requires intentional planning around the questions posed in a mathematics classroom. It is critical to consider “who is being positioned as competent, and whose ideas are featured and privileged” within the classroom through both the types of questioning and who is being questioned. Mathematics classrooms traditionally ask short answer questions and reward students that can respond quickly and correctly. When questioning seeks to understand students’ thinking by taking their ideas seriously and asking the community to build upon one another’s ideas a greater sense of belonging in mathematics is created for students from marginalized cultures and languages. For example, when studying the connections between proportional relationships, lines, and linear equations the pattern of questions within the classroom is critical because it allows students to communicate mathematically. It allows them to answer questions about rate of change, linear and proportional relationships. They can communicate their method of understanding the difference between linear and proportional relationships, while making a connection between them. This allows the teacher to formatively assess</li> </ul>

	<i>school and society?</i>	them while checking for understanding. The questions can be oral, on paper (exit tickets) or group questions that allow students to discuss different strategies in a safe classroom environment (It is important that the teacher create an environment where students feel safe to share).

## Planning for Multi-Layered System of Supports

### Vertical Alignment

<i>Previous Learning</i>	<i>Current Learning</i>	<i>Future Learning</i>
<ul style="list-style-type: none"> <li>In 6th grade, students used ratio, rate reasoning, and unit rate. In 7th grade, students made connections to the 6th grade skills to compute unit rates and recognize and represent proportional relationships</li> </ul>	<ul style="list-style-type: none"> <li>In 8th grade, learners will use these skills to compare properties of functions given a table, a graph, or an equation.</li> </ul>	<ul style="list-style-type: none"> <li>In future courses, students will understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane, often forming a curve (which could be a line).</li> </ul>

### Suggested Instructional Strategies

#### Pre-Teach

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that rehearses new mathematical language in connection with prior learning when studying the connections between proportional relationships, lines, and linear equations because the language of the 8th grade cluster is completely new, but the skills needed for success began in 6th grade. Previously to 8th grade, slope is referred to as rate, unit rate, and constant of proportionality. Constant proportionality is structured in the $y=kx$ form, so shifting students from $y=kx$ to $y=bx$ or even $y=mx+b$ will take a shift in language and terminology, yet the skills of finding slope have already been developed.
Intensive	<i>What critical understandings</i>	<i>6.RP.A.2: This standard provides a foundation for work</i>

	<p><i>will prepare students to access the mathematics for this cluster?</i></p>	<p><i>with understanding ratio relationships and calculating rate which would support finding slope because it introduces a relationship between two values. This standard also introduces ratios written as a fraction which supports dividing values to produce a rate. If students have unfinished learning within this standard, based on assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.</i></p>
--	---	---

**Universal Support Framework**

A student should know/understand...	A student should be able to do...	<b>Potential Scaffolds</b>
<ul style="list-style-type: none"> <li>● Slope is a unit rate.</li> <li>● Why is the slope between two points on the same non-vertical line the same?</li> <li>● In the general equation of a line, <math>y = mx + b</math>, <math>m</math> is the slope and <math>b</math> is the <math>y</math>-intercept.</li> <li>● There are four types of slope - positive, negative, zero, and undefined.</li> </ul>	<ul style="list-style-type: none"> <li>● Find and compare proportional relationships given a graph, a table, and an equation.</li> <li>● Identify the slope, the <math>y</math>-intercept, and write the equation <math>y = mx</math> or <math>y = mx + b</math> when given a line on a graph.</li> <li>● Explain what the slope and <math>y</math>-intercept represent on a graph and in context with the proportional relationship.</li> </ul>	<ul style="list-style-type: none"> <li>● Build on students' experience with the following skills:               <ul style="list-style-type: none"> <li>○ Use ratio, rate reasoning and unit rate.</li> <li>○ Compute unit rates</li> <li>○ Recognize and represent proportional relationships.</li> </ul> </li> <li>● Cognitive Strategies               <ul style="list-style-type: none"> <li>○ Repeatedly model the strategies</li> <li>○ Monitor the students' use of the strategies</li> <li>○ Provide feedback to students</li> <li>○ Teach self-questioning and self-monitoring strategies</li> <li>○ Introduce multiple means of representation for mathematical ideas</li> </ul> </li> <li>● Encourage students to use alternative tools to better access the grade level content. Examples include:               <ul style="list-style-type: none"> <li>○ Graphic Organizer (Rule of Four- Equation, Table, graph, and verbal)</li> <li>○ Slope Visual Chart</li> <li>○ Free Writing- Describing slope</li> </ul> </li> </ul>

**Re-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on understanding the connections between proportional relationships, lines, and linear equations by critiquing student approaches/solutions to make connections through a short mini-lesson because there are several components and representations of 5 information in this cluster. Students will be presented with tables, graphs, ordered pairs, equations, and triangles. Students may be able to recognize a relationship between values when presented in a table, but struggle with reading graphs. Taking the time to critique approaches/ make connections with the way other students arrive at an answer will model successful ways to approach a task or problem.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit understanding the connections between proportional relationships, lines, and linear equations by helping students move from specific answers to generalizations for certain types of problems because when placed in real world context, students can often draw the correct connections between variables based on experience and not mathematical computation. For students struggling with mathematical recognition, it may be valuable to focus on generalizations involving proportional relationships to boost confidence and understanding before addressing misconceptions within the process of finding slope or using similar triangles to show slope is the same.
<b>Extension</b>		
	<i>Essential Question</i>	<i>Examples</i>
	What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?	For example, some learners may benefit from an extension such as open-ended tasks linking multiple disciplines when studying the connections between proportional relationships, lines, and linear equations because value relationships cross over into many disciplines. For example, students could develop an equation and model to determine cost/profit of items in a school store to guarantee enough funding for a field

		trip/class party

CCSS Domain	CCSS Cluster	
Expressions and Equations	Analyze and solve linear equations and pairs of simultaneous linear equations	
<b>Culturally and Linguistically Responsive Instruction</b>		
<b>Relevance to Families and Communities</b>	During a unit focused on how to analyze and solve linear equations and pairs of simultaneous linear equations, consider options for learning from your families and communities the cultural and linguistic ways this mathematics exists outside of school to create stronger home to school connections for students, for example, provide students with real-world examples that are in context and relative to their cultural and linguistic background. Provide questions that help them make connections to concepts and their cultural understanding of math.	
<b>Cross-Curricular Connections</b>	<ul style="list-style-type: none"> <li>● <b>Science:</b> Compare linear relationships and systems of equations in scientific data.</li> </ul>	
<b>Validate/Affirm/Build/Bridge</b>	<ul style="list-style-type: none"> <li>● <i>How can you design your mathematics classroom to intentionally and purposefully legitimize the home culture and languages of students and reverse the negative stereotypes regarding the mathematical abilities of students of marginalized cultures and languages?</i></li> <li>● <i>How can you create connections between the cultural and linguistic behaviors of your students' home culture and language, the culture and language of school mathematics to support students in creating mathematical identities as capable mathematicians that can use mathematics within</i></li> </ul>	<ul style="list-style-type: none"> <li>● Building Procedural Fluency from Conceptual Understanding: Instruction should build from conceptual understanding to allow students opportunities to make meaning of mathematics before focusing on procedures. When new learning begins with procedures it privileges those with strong prior familiarity with school mathematics procedures for solving problems and does not allow learning to build for more methods for solving tasks that occur outside of school mathematics. For example, when studying how to analyze and solve linear equations and pairs of simultaneous linear equations the types of mathematical tasks are critical because students should understand where to look on a graph to find the solution. They should be able to analyze and interpret the solution when the lines intersect, when they are parallel or when they coincide.</li> </ul>

	<i>school and society?</i>	
<b>Planning for Multi-Layered System of Supports</b>		
<b>Vertical Alignment</b>		
<i>Previous Learning</i>	<i>Current Learning</i>	<i>Future Learning</i>
<ul style="list-style-type: none"> <li>In 6th and 7th grade, students use variables to write expressions and equations and apply the properties of operations to generate equivalent expressions. Students also solve equations, including those that involve real-world problems.</li> </ul>	<ul style="list-style-type: none"> <li>In 8th grade, students use the equation of a linear model to solve problems in the context of bivariate (two variables) measurement data, interpreting the slope and intercept. Students will use these equations to graph linear and proportional relationships.</li> </ul>	<ul style="list-style-type: none"> <li>In high school, students will create, solve, and rewrite equations, inequalities, and systems of equations (include equations arising from linear, exponential, and quadratic functions) They will make connections to this content to construct a viable argument to justify a solution method.</li> </ul>
<b>Suggested Instructional Strategies</b>		
<b>Pre-Teach</b>		
<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	<i>What pre-teaching will prepare students to productively struggle with the mathematics for this cluster within your HQIM?</i>	For example, some learners may benefit from targeted pre-teaching that provides additional time for confusion to happen with new mathematical ideas when studying analyzing and solving linear equations and pairs of simultaneous linear equations because 8th grade is the first-time students will be connecting equation with lines and graphs and interpreting graphs to find solutions for linear equations. Students' previous work with linear equations stopped at isolating and solving for single variables by using inverse operations. Students will need additional time to connect the values in an equation to graphing and drawing conclusions from graphed lines.
Intensive	<i>What critical understandings will prepare students to access the mathematics for this cluster?</i>	<i>6.EE.B.5 AND 7.EE.B.4: These standards provide a foundation for work with analyzing and solving linear equations and pairs of simultaneous linear equations because it is critical that students understand that an</i>

*equation can be simplified and solved by using a specific process. Students must understand the context of the variable, and it's real-world implication. If students have unfinished learning within this standard, based on 4 assessment data, consider ways to provide intensive pre-teaching support prior to the start of the unit to ensure students are ready to access grade level instruction and assignments.*

**Universal Support Framework**

Examples include:               <ul style="list-style-type: none"> <li>○ Colored Pencils</li> <li>○ Multiplication Charts</li> <li>○ Graphic Organizers</li> </ul> </li> </ul>

**Re-Teach**

<i>Level of Intensity</i>	<i>Essential Question</i>	<i>Examples</i>
Targeted	What formative assessment data (e.g., tasks, exit tickets, observations) will help identify content needing to be revisited during a unit?	For example, students may benefit from re-engaging with content during a unit on analyzing and solving linear equations and pairs of simultaneous linear equations by clarifying mathematical ideas and/or concepts through a short mini-lesson because students may struggle procedurally to solve linear equations for solutions, especially when working with rational coefficients, and without this crucial understanding, students will struggle with the entirety of the cluster.
Intensive	What assessment data will help identify content needing to be revisited for intensive interventions?	For example, some students may benefit from intensive extra time during and after a unit in analyzing and solving linear equations and pairs of simultaneous linear equations by confronting student misconceptions because many misconceptions in this unit reflect low procedure and fluency skills when it comes to manipulating values using the four operations or reading a graph and understanding x values, y values. Confronting misconceptions about appropriately and correctly using the four operations and recognizing key components of general graphs can improve student learning as these skills are extended with linear equations and graph reading.
<b>Extension</b>		
	<i>Essential Question</i>	<i>Examples</i>
	What type of extension will offer additional challenges to 'broaden' your student's knowledge of the mathematics developed within your HQIM?	For example, some learners may benefit from an extension such as the application of and development of abstract thinking skills when studying analyzing and solving linear equations and pairs of simultaneous linear equations because the recognition of solutions satisfying simultaneous equations is clear and non-examples are also clear when looking at a graph, however justifying an example from a non-example becomes abstract when placed in context. Students needing extension could be given graphs of examples and non-examples and be asked to create real-world mathematical word problems that could be represented by each graph.
